Definition may be (1) **rhetorical**, in which case it gives the meaning loosely, and freely uses accidental, relative, and extrinsic properties. This form includes (*a*) **etymological definition**, which depends on the meaning of the root of the word; (*b*) **analytical d.**, which analyzes the conception already embodied in a current word or phrase; and (*c*) **descriptive d.**, which gives concrete characteristics or synonyms or employs the casual substitution of phrases. Some words can only be defined thus. Or (2) it may be **logical d.**, in which case the conception expressed is separated from all others by presenting its essential qualities. Perfect logical definition has two forms, according as it regards the general term (*a*) as a *class term* or (*b*) as a *concept term*. In the former the definition must give the *next higher genus*, and the *difference;* in the latter the *properties* of the higher genus and the *properties* which distinguish the concept as a species from other species. See DIFFERENCE; GENUS. Imperfect logical definition includes definition by (*a*) *division*, (*b*) *colligation*, (*c*) *resolution*, and (*d*) *composition*. See these words. Or (3) **abundant d.**, that is, including characters the omission of which would impair adequacy; or **adequate d.**, that is, applying only to every individual of the class defined. From still another point of view definitions are classified as *nominal*, *real*, and *genetic*, as they have to do with mere names, essentials, or causes.

We must give in a *definition* the briefest possible statement of such qualities as are sufficient to distinguish the class from other classes. W. S. JEVONS *Lessons in Logic* p. 109. [MACM. 1878.]

4. The settling, marking out, or determining of the boundary or limits of a thing, or the state of being so determined: in optics, used specifically of the power of a lens to give a clear, distinct image; as, the *definition* of the telescope was perfect.

The day was clear, and every mound and peak traced its outline with perfect *definition* against the sky.

HOLMES *Pages from an Old Volume* p. 255. [H. M. & CO.]

[< L. *definitio(n-)*, < *defino;* see DEFINE.]

SYN.: comment, commentary, description, explanation, exposition, interpretation, translation. A *definition* is exact, an *explanation* general; a *definition* is formal, a *description* pictorial. A *definition* must include all that belongs to the object defined, and exclude that which does not; a *description* may include only some general features; an *explanation* may simply throw light upon some point of special difficulty. An *exposition* undertakes to state more fully what is compactly given or only implied in the text; as, an *exposition* of Scripture. *Interpretation* is ordinarily from one language into another, or from the language of one period into that of another; it may also be a statement giving the doubtful or hidden meaning of that which is recondite or perplexing; as, the *interpretation* of a dream, a riddle, or of some difficult passage. *Definition*, *explanation*, *exposition*, and *interpretation* are ordinarily blended in a *commentary*, which may also include *description*. A *comment* is upon a single passage; a *commentary* may be the same, but is usually understood to be a volume of *comments*.

In the Baumé scale used on hydrometers for liquids heavier than water, the 0° mark indicates the depth to which the hydrometer will sink in pure water, and the 15° mark, the depth in a 15% salt solution; and in hydrometers for liquids lighter than water, the 0° mark indicates a 10% salt solution, and the 10° mark, pure water. The degrees are all equal in length and hence have no direct relation to specific gravity. Baumé degrees may be approximately converted into specific gravity by the following formulas in which b = degrees Baumé: (a) for liquids with specific gravity greater than water, sp. gr. = 144 + (144 − b); (b) for liquids with specific gravity less than water, sp.gr. = 144 ÷ (134 + b).— **by degrees,** little by little; gradually.— **d. of a complex,** the degree of an equation that connects its line coordinates.— **d. of a curve** or **surface** (*Math.*), the order of a curve or surface. See ORDER, *n.*— **d. of a group,** the number of elements in a group upon which operations are performed.— **d. of an equation,** the degree of the highest term of the equation.— **d. of a ruled surface** (*Geom.*), the number of the surface elements in a linear complex which is equivalent to the number of its intersection points on any straight line.— **d. of a twisted curve** (*Geom.*), the number of intersections of a twisted curve with a plane.— **d. of curve,** in a railroad curve, the angle at the center which is subtended by a standard chord: the chord used in America is 100 feet; in England 66 feet.— **d. of latitude,** a north-and-south distance on the earth's surface between two parallels of latitude that are one degree apart.— **d. of longitude,** an east-and-west distance between two meridians of longitude that are one degree apart.— **degrees of ascent,** in occultism, the three great stages of ascent to God, mystically represented by baptism, the eucharist, and unction. See PURIFICATION; ILLUMINATION; PERFECTION.— **geothermic d.,** the average distance into the earth equivalent to an increase of one degree in temperature.— **Lambeth d.,** a degree conferred by the archbishop of Canterbury: somewhat restricted in the privileges it carries.— **mercury-in-glass degrees,** thermometric degrees in which differences of temperature are measured by the relative expansions of mercury in glass: they vary from the gas-thermometer degrees because the expansion of the mercury is not uniform.— **platinum degrees,** thermometric degrees in which differences of temperature are measured by the relative changes in the electric resistance of a platinum wire.— **square d.,** an area lying between two successive degrees of longitude, and between any two successive degrees of latitude that intersect them.— **third d.** **1.** *Freemasonry.* The degree of Master Mason, which is conferred elaborately. **2.** [U. S.] In police practise, the process of examining a prisoner, or an accomplice of a person suspected of a crime, for the purpose of securing information concerning it: sometimes accompanied by unduly severe treatment.— **to a d.,** extremely; as, magnificent *to a degree*: a Briticism.

While agreeing in the attempt to establish so-called natural religion on a rational basis, the English and Continental advocates of deistic belief assumed various attitudes toward the prevalent theistic doctrines of their time; hence the word.

Deism has been used in various senses, as, (1) belief in an intelligent and eternal Being, with denial of providence and moral government; (2) belief in God and providence, with denial of moral distinctions and moral government; (3) belief in God and his moral perfections, with denial of a future state; (4) by Kant, belief in an infinite force inherent in matter, as the first cause, with denial of a free personal God: (5) more commonly, that given in the definition. See K.-F. *Vocab. Philos.* p. 130. [SH. & CO. 1878.]

The doctrines were first promulgated in England during the end of the 17th century and passed through various phases which were given expression to from time to time by such prominent deists as Lord Herbert of Cherbury (1581–1648), Charles Blount (1654–93), John Toland (1670–1722), Lord Shaftesbury (1671–1713), Anthony Collins (1670–1729), Matthew Tindal (1657–1733), and Lord Bolingbroke (1678–

SYN.: confer, consider, consult, debate, meditate, ponder, reflect, weigh. Deliberating* always carries the idea of slowness; *consulting* is compatible with haste; we can speak of a hasty consultation, not of a hasty deliberation. *Debate* implies opposing views; *deliberate,* simply a gathering and balancing of all facts and reasons. We *consider* or *deliberate* with a view to action, while meditation may be quite purposeless. Where the tributary is rapid the *fan delta* frequently pushes the main stream against the opposite wall of the valley, or blocks it and forms a lake, as Lake Pepin, where the Chippewa runs into the Mississippi.

(2) The totality of such effectual desire in a given market with reference to a given commodity at a certain price.

The term **effectual demand** is used by Adam Smith to denote the will and ability of a group of individuals to pay the natural price for a commodity, that is, such a price as will enable the vendors to keep it upon the market at a reasonable profit to themselves. **Demand and supply,** the relation in trade between the desire to sell and the desire to purchase, or between the quantity of a commodity purchased and the quantity offered for sale, is the factor which determines price. Yet it is itself reacted upon by a change in prices. By the **law of demand and supply,** if in a given market the supply of any commodity is increased while the *demand* remains stationary, the price necessarily falls; on the other hand, if the *demand* increases without a corresponding increase in the supply, the price will rise. This law is, however, only one of several factors which regulate sales and prices. The tendency of the supply in a given market to meet the *demand* at a given price (**equation of demand and supply**) is due to the adjusting action of competition. The graphical plotting of the changes in the scale of prices due to this process is known as the **demand curve.** The mutual *demand* existing between two non-competitive economic groups for each other's profits (**reciprocal demand**) is brought about in international trade by the tendency of a nation's imports to balance its exports, and determines the reciprocal value of products between non-related groups of the same nation.

—**Democratic party**, one of the two greater political parties in the United States. The old Republican or Anti-Federalist party abandoned that name and assumed that of *Democratic*, in 1828, as "a novel, distinct, and popular name." This was the birth-time of the present Democratic party. This party has always advocated a rigid adherence to the principles of the Constitution and the equality and autonomy of the States, while opposing the centralization of power in the Federal government. It has stood for equal taxation and a low tariff for revenue only as opposed to a high protective tariff. Its platform in 1896 called for the free and unlimited coinage of silver at a ratio of 16 to 1; those of 1900 and 1904 opposed the retention of the insular possessions of the United States and formulated the doctrine of anti-imperialism; that of 1908 declared in favor of a downward tariff reform with a largely extended free list, of the enforcement of the criminal law against guilty trust magnates and the limitation of the powers of private monopolies, of a tax upon individual and corporate incomes, of congressional control of interstate commerce, of the right of labor to organize, and of conservation of the national resources, and again condemned imperialism. This party has carried four presidential elections since the Civil War, those of 1884, 1892, 1913 and 1917, in which Grover Cleveland and Woodrow Wilson were the standard-bearers of the party.— **D.-Republican party**, the name assumed by the Anti-Federalist party after the Constitution of the United States became popular, in 1791, when they perceived the inappropriateness of their party name.

SYN.: aim, device, end, final cause, intent, intention, object, plan, project, purpose, scheme. *Design* refers to the adaptation of means to an *end,* the correspondence and coordination of parts, or of separate acts, to produce a result; *intent* and *purpose* overleap all particulars, and fasten on the *end* itself. *Intention* is simply the more familiar form of the legal and philosophical *intent. Plan* relates to details of form, structure, and action, in themselves; *design* considers these same details all as means to an *end.* The *plan* of a campaign may be for a series of sharp attacks, with the *design* of thus surprizing and overpowering the enemy. A man comes to a fixed *intention* to kill his enemy; he forms a *plan* to entrap him into his power, with the *design* of then compassing his death; as the law can not read the heart, it can only infer the *intent* from the evidences of *design. Intent* denotes a straining, stretching forth toward an *object; purpose* simply the placing it before oneself; hence, we speak of the *purpose* rather than the *intent* or *intention* of God. We hold that the marks of *design* in nature prove it the work of a great Designer. *Intention* contemplates the possibility of failure; *purpose* looks to assured success; *intent* or *intention* refers especially to the state of mind of the actor; *purpose* to the result of the action. Syn.: appetency, appetite, aspiration, concupiscence, coveting, craving, hankering, inclination, longing, wish. *Inclination* is the mildest of these terms; it is a quiet, or even a vague or unconscious, tendency. Even when we speak of a strong or decided *inclination* we do not express the intensity of *desire. Desire* has a wide range, from the highest objects to the lowest; *desire* is for an object near at hand, or near in thought, and viewed as attainable; a *wish* may be for what is remote or uncertain, or even for what is recognized as impossible. *Craving* is stronger than *hankering; hankering* may be the result of a fitful and capricious *appetite; craving* may be the imperious and reasonable demand of the whole nature. *Longing* is a reaching out with deep and persistent demand for that which is viewed as now distant, but at some time attainable; as, the captive's *longing* for release. *Coveting* ordinarily denotes wrong *desire* for that which is another's. Represent the n^2 constituents by n letters, $a, b, c, \ldots k$, to each of which n suffixes, $1, 2, 3, \ldots n$, are applied in succession. One term of the determinant will be the product, $a_1 b_2 c_3 \ldots k_n$, and all the other terms are formed from this by permuting the suffixes 1, 2, etc., among the letters, making $1 \times 2 \times 3 \times \ldots \times n$ terms in all. The signs of all the terms produced by odd permutations are to be changed. The algebraic sum of all the terms thus formed is the determinant. It is expressed algebraically by arranging the constituents as in the illustration.

The arrangement of the constituents in a square is called the *matrix* or *array* of the determinant. The diagonal line of constituents $a_1 b_2 c_3$, etc., is called the *principal diagonal;* the diagonal through the other two corners is known as the secondary diagonal.

3. [Rare.] Right-handedness. [< L. *dexteritas,* < *dexter,* right.]

SYN.: adroitness, aptitude, cleverness, expertness, readiness, skill. *Adroitness,* from the French, and *dexterity,* from the Latin, might each be rendered "right-handedness"; but *adroitness* carries more of the idea of eluding, parrying, or checking some hostile movement, or taking advantage of another in controversy; *dexterity* conveys the idea of doing, accomplishing something readily and well, without reference to any action of others. We speak of *adroitness* in fencing, boxing, or debate; of *dexterity* in horsemanship, in the use of tools, weapons, etc. *Aptitude* is a natural *readiness,* which by practise may be developed into *dexterity. Skill* is more exact to line, rule, and method than *dexterity. Dexterity* can not be communicated, and oftentimes can not even be explained by its possessor; *skill* to a very great extent can be imparted; "skilled workmen" in various trades are numbered by thousands. (2) In a loose sense, a provincial mode of speech or pronunciation as differing from a literary standard.

Dialect, in the proper sense of the word, is not to be defined merely as a non-literary relative of a literary language. It is that, of course, but it is more than that. It is not based always upon distinctions of locality or degrees of education, although in popular usage this is what is meant when *dialect* is spoken of. . . . But the word *dialect* may with equal truth be applied to the special vocabulary and phraseology of any class or profession, no matter where the members of it may have their habitat. Thus there is a lawyers' *dialect* and a stockbrokers' *dialect* and a physicians' *dialect* and a thieves' *dialect* and a *dialect* of journalism. In all these and many others there exists a swarm of words and phrases and allusions which are as far removed from the current language as the patois of a French-Canadian voyageur is removed from the precise and measured diction of an Academician.

di"a-lec'tic, *n.* **1.** Logic in general, whether as a science or as an art; also, specifically, (1) the logic of discursive argument, of debate and refutation, and (2) the logic of probable reasoning; the art of determining the value of opinions or of distinguishing truth from error by the processes of reasoning: often used in the plural; as, the science of *dialectics*. Plato used the word *dialectic* to mean either the discussion of a conception by question and answer, the determination of truth and error by a process of analysis, or the metaphysics of ideas as an interpretation of the nature and laws of all being. Aristotle limited the word to the use of argument for purposes of persuasion (see def. 2). In Roman and medieval educational schemes it was more nearly equivalent to our modern use. With Kant in his *Transcendental Logic*, *transcendental dialectic*, or the specious but fallacious use of the intellect in attempts to apply its reasonings to subjects which transcend all human experience, was contrasted with its *elemental analytic*, or the constructive use of intellect. Hegel regarded *dialectic* as the process through which reason, by reconcilement of opposites, advances in self-development to the perfection of absolute spirit.

It is certain, that skill in *dialectics* is more an art than effort of genius. WHIPPLE *Essays and Reviews, Webster* in vol. p. 168. [O. & CO. 1871.]

dī'a-mond, 1 dąı'ə-mənd; 2 dī'a-mond (XIII), *n.* **1.** A mineral consisting essentially of carbon crystallized in the isometric system, generally in octahedron form. When pure it is a valuable gem-stone of great refractive power with a beautiful play of prismatic colors, especially when cut; its hardness is 10, and its specific gravity 3.52.

The usually colorless, it is sometimes tinted by mineral oxids, black, blue, blue-white, pink, brown, green, orange, red or yellow. The colorless varieties when without flaw are of the *first water*, and when inferior are called *by-water*, or *off color*. The diamond, the hardest substance known, is combustible. It has been found chiefly in Brazil, India, and South Africa, but some stones have been found in Australia, China, Russia, and the United States.

Great labor is required in cutting or bringing the rough diamond into the form that will best display its beauties (usually the *brilliant*, and rarely the *briolette*, *rose* or *table* shape). See these words. Diamond-dust is used in polishing diamonds, and fragments and massive varieties are employed in various ways for cutting and boring. See BORT.

Forms of Cut Diamonds.
1. Brilliant cut, *a, b, c.* 2. Regent or Pitt cut. 3. Victoria cut. 4 Kohinoor cut. 5. Double rose (side view). 6. Rose cut. 7. Table cut. 8. Briolette (Indian cut).

The value of diamonds depends upon their weight, color, brilliancy, and perfection. The Cullinan is the largest diamond of which anything definite is known. It weighed in the rough when found at the Premier Mines, near Pretoria, South Africa, 3,025¾ carats. See CARAT. After cleavage, rough-cutting, and polishing, the two sections of the stone weighed respectively 516½ and 309¾ carats. From this will be observed the large loss in weight inseparable from the operations necessary to bring the diamond to the desired form and brilliancy.

2. A natural crystal face of the stone, used in cutting glass, etc. **3.** A lozenge-shaped or rhombic geometric figure; a figure or object bounded by four equal straight sides or lines, and having two of the angles acute and two obtuse; a rhomb or lozenge. **4.** *Baseball.* The square space enclosed by the lines 90 feet in length, connecting the bases; sometimes, by extension, the whole field. **5.** *Her.* The tincture black, or sable, in blazoning by means of precious stones. '*Diamond.*' . . . 'Diamant' and 'adamant' are in fact no more than different adoptions by the English tongue of one and the same Greek, which afterwards became a Latin, word. TRENCH *English, Past and Present* p. 352. (R. P. & CO. 1889.)

SYN.: expression, language, phrase, phraseology, style, vocabulary, wording. An author's *diction* is strictly his choice and use of words, with no special reference to thought; *expression* regards the words simply as the vehicle of the thought. *Phrase* and *phraseology* apply to words or combinations of words which are somewhat technical; as, in legal *phraseology*; in military *phrase*. *Diction* is general; *wording* is limited; we speak of the *diction* of an author or of a work, the *wording* of a proposition, of a resolution, etc. (*verbiage* never bears this sense; see CIRCUMLOCUTION). The *language* of a writer or speaker may be the national speech he employs; as, the English or French *language*; or the word may denote his use of that *language*; as, the author's *language* is well (or ill) chosen. *Style* includes *diction*, *expression*, rhetorical figures such as metaphor and simile, the effect of an author's prevailing tone of thought, of his personal traits — in short, all that makes up the clothing of thought in words; thus, we speak of a figurative *style*, a frigid or an argumentative *style*, or of the *style* of Macaulay or Prescott, etc.

SYN.: cyclopedia, encyclopedia, glossary, lexicon, vocabulary. An *encyclopedia*, as the name implies, aims to sweep the whole circle of knowledge; a *dictionary* simply to define words. There is a tendency at present to include in *dictionaries* much encyclopedic matter. A *vocabulary* is properly a list of words. In the United States the matter is regulated in the several States by statutes, which detail explicitly the acts that may or may not be performed on such days, ministerial acts being frequently permissible when strictly judicial acts are prohibited. The Frankfort assembly, which deliberated in 1848 on the restoration of the empire, and the subsequent assemblies of the German Bund, were called the *Diets;* but the name is not applied to the Reichstag of the present German empire.

Syn.: contrariety, disagreement, discrepancy, discrimination, disparity, dissimilarity, dissimilitude, distinction, diversity, inconsistency, inequality, unlikeness, variation, variety. A *difference* is in the things compared; *discrimination* is in our judgment of them; a *distinction* is in our definition or description or mental image of them. Careful *discrimination* of real *differences* results in clear *distinctions. Disparity* is stronger than *inequality,* implying that one thing falls far below another; as, the *disparity* of our achievements when compared with our ideals. *Dissimilarity* is between things sharply contrasted; there may be a *difference* between those almost alike. There is a *discrepancy* in accounts that fail to balance. *Variety* involves more than two objects; so, in general, does *diversity; variation* is a *difference* in the condition or action of the same object at different times. *Disagreement* is not merely the lack, but the opposite, of agreement; it is a mild word for opposition and conflict; *difference* is sometimes used in the same sense. See REMAINDER.— Ant.: agreement, consonance, harmony, identity, likeness, resemblance, similarity, uniformity, unity.— Prep.: difference *between* the old and the new; differences *among* men; a difference *in* character: *of* action, *of* style; (less frequently) a difference (controversy) *with* a person; a difference *of* one thing *from* (incorrectly *to*) another.— **competitive difference** (*Logic*), same as DIFFERENTIA.— **constitutive d.** (*Logic*), same as DIFFERENTIA.— **contact potential d.** (*Elec.*), that created by bringing into contact two dissimilar metals or other substances without the intervention of a battery, as zinc and copper, the former of which is positively and the latter negatively electrified by contact.— **descensional d.** (*Astron.*), same as ASCENSIONAL DIFFERENCE.— **dif'fer-ence-en"gine,** *n.* A machine for calculating mathematical tables.— **d. equation** (*Math.*), an equation of finite differences or enlargements.— **d. hypothesis** (*Psychophys.*), in the practical application of Weber's law, the hypothesis that equal stimulus ratios correspond to equal sensation differences: opposed to the ratio hypothesis, which holds that they correspond to equal sensation ratios. — **d.-threshold,** *n. Psychophys.* In the application of Weber's law, a term proposed by Fechner for the ratio of the least discernible difference to the original standard sensation; a constant fraction expressed by the formula $\frac{d+d'}{2}$. This represents the minimum increment of stimulus $\frac{S+d}{S+d-d'}$ sufficient to produce a noticeable difference of sensation at maximal attention, after all possible errors have been eliminated.— **d.-tone,** *n. Acoustics.* A combinational tone resulting from the simultaneous sounding of two simple tones. It is subdivided into (1) **first d.-tone,** composed of the fundamental and an upper partial and having a frequency, *f*, expressed by the formula $f = u - l$, where *u* is the frequency of the upper partial and *l* of the fundamental or lower tone. (2) **second d.-tone,** composed of the first difference-tone and one of its two primaries or one of their upper partials, the formula of whose frequency is $f = 2l - u$. See RESULTANT TONE, under RESULTANT.— **divisive d.** (*Logic*), same as DIFFERENTIA.— **electromotive potential d.** (*Elec.*), the difference of potential existing between two points in a closed circuit which produces the flow of current.— **essential d.** (*Logic*), same as DIFFERENTIA.— **first d.** 1. *Math.* The result of a single performance of the operation of *taking the difference,* or increasing the independent variable of a function by unity, symbolized by the letter Δ. From this are derived **second d.,** the *difference* between successive terms of a series of first *differences;* **third d.,** the difference between the second *differences;* **fourth d.,** etc. 2. *Logic.* The fundamental difference.— **frequency d.** (*Phys.*), the difference between two frequencies of vibration expressed as a numerical quantity, as that between the number of complete alternations per second of two electric currents.— **individual differences** (*Zool.*), the many slight and often minute but strongly marked differences manifesting themselves in the progeny of the same pair or in individuals of the same species when subjected to precisely similar environment-conditions. **individuant differences†.— inverse d.** (*Math.*), the sum of all the values of a function for all the discrete values of the independent variable less than the actual value. [C.] — **method of d.,** see INDUCTIVE METHOD, under INDUCTIVE.— **method of just-discernible, least, or minimal differences** (*Psychophys.*), one of the four accepted methods of sensation-measurements. It consists in taking a standard sensation and adding to it little by little until the addition is perceptible, and then subtracting from the total sensation thus obtained until the effect of the subtraction is felt. Half the sum of these two differences is the *just-discernible difference.* Its formula is $\frac{d+d'}{2}$. Compare DIFFERENCE-THRESHOLD.— **mixed differences** (*Math.*), those partly finite and partly infinitesimal.— **partial d.** (*Math.*), the increment to a function of two variables due to increasing one of them by unity.— **phase d.** (*Elec.*), the difference between the times of the asynchronous maxima or zero values of two alternating magnitudes, such as current or electromotive force; expressed as an angular value or as the fraction of a period.— **potential d.** 1. *Elec.* (1) The difference between the absolute potentials of two given points in space. (2) The work required to move a unit of electricity in one direction between such points against electric repulsion. (3) The energy accumulated by moving this unit in the reverse direction. 2. *Socionomy.* The adaptability evidenced by a social population, as in its capacity for assimilating diverse civilizations and cultures.. — **singular d.** (*Zool.*), same as INDIVIDUAL DIFFERENCE.— **specific d.,** same as DIFFERENTIA.— **taking the d.** (*Math.*), see FIRST DIFFERENCE.— **to split the d.,** to compromise by means of equal mutual concessions; to meet each other half-way.
